GET TO KNOW YOUR

GET TO KNOW YOUR *plants*

LOOK CLOSER

Avoid cold drafts or heaters. Rotate your plant occasionally for even growth. Wipe dust off leaves so they can absorb light.

Repot when the roots outgrow the pot, the plant becomes too big, or if bugs, mold, or fungus appear.

KEEP IT GROWING

Many houseplants can grow new roots from cuttings. This is called propagation.

1. Cut a healthy stem below a node
2. Place it in water
3. Wait for roots to grow
4. Plant it in soil

DON'T FORGET !!!

LET THE LIGHT IN

Most houseplants prefer bright, indirect light, which means sunlight near a window but not directly hitting the leaves for long periods.

If a plant grows slowly, becomes droopy, or has dull leaves, it may need more light.

WATER WHEN?

Overwatering is the most common mistake. Many plants prefer their soil to dry out a little between waterings.

Yellow leaves means possible overwatering

Drooping or dry/falling leaves may need water

DOWN THE DRAIN

Plants don't like sitting in water. When soil stays wet for too long, roots can't breathe and may begin to rot.

Always choose pots with holes

Use loose,well-draining soil

Don't let water sit in the saucer

WHATS IN THE AIR?

A little extra humidity can help. Placing plants in a humid space, like a kitchen or bathroom, can make a difference.

Most houseplants come from warm, humid environments. Indoors, dry air and sudden temperature changes can stress them.
